Accessibility audit report

Generated October 19, 2026 10:07 am

A solid foundation to build on.

Start with the critical problems: they make the biggest difference for your visitors.

What to fix

Problems are listed most severe first. Select "?" next to any problem to learn why it matters and how to fix it.

Images are missing a text description

Critical · WCAG 1.1.1 · Needs your action · 3 elements · on 3 pages

Why it matters Screen readers read an image's alt text out loud. Without it, visitors hear only "image" or the file name, so they miss whatever the picture shows or does.

Who it affects Blind and low-vision visitors using screen readers; also search engines

How to fix Add alt text that describes what the image shows or does, in a short sentence. If the image is purely decorative, give it empty alt text so screen readers skip it. In WordPress, set this in the Media Library or the image block's settings.

Technical check: Images must have alternative text

Images in your posts are missing a text description

Critical | WCAG 1.1.1 | Needs your action | 1 element · on 1 page

Why it matters This image was found in post content without any alt attribute, so screen readers have nothing to announce.

Who it affects Blind and low-vision visitors using screen readers

How to fix Edit the post, select the image and fill in "Alternative text" in the block settings. Use empty alt text only for decorative images.

Technical check: Images in post content must have alternative text

Lists contain items that aren't list items

Serious | WCAG 1.3.1 | Needs your action | 5 elements · on 5 pages

Why it matters Screen readers announce how many items a list has and let users jump between them. Other elements placed directly inside the list break that structure.

Who it affects Screen reader users

How to fix Make sure <ul> and <ol> contain only <li> elements directly. This often comes from a theme or menu plugin, so you may need to ask its developer.

Technical check: <ul> and <ol> must only directly contain <li>, <script> or <template> elements

Where it was found

Home page

Text is hard to read against its background

Serious | WCAG 1.4.3 | Fix with approval | 2 elements · on 2 pages

Why it matters When text and background colors are too similar, the text fades out. WCAG asks for a contrast ratio of at least 4.5:1 for normal text and 3:1 for large text.

Who it affects People with low vision or color blindness, older visitors, anyone reading on a phone in sunlight

How to fix Make the text darker or the background lighter (or the opposite on dark designs) until the ratio passes. You can usually change these colors in your theme's style settings or the block's color settings.

Technical check: Elements must meet minimum color contrast ratio thresholds

Where it was found

Page

```
<p style="color:#bbbbbb;background:#ffffff">This text has very low contrast.</p>
```

Search results

```
<p style="color:#bbbbbb;background:#ffffff">This text has very low contrast.</p>
```

Media Library images have no alt text

Moderate | WCAG 1.1.1 | Needs your action | 1 element · on 1 page

Why it matters Alt text set in the Media Library is used automatically wherever the image is inserted later. Leaving it empty means every future use starts without a description.

Who it affects Blind and low-vision visitors using screen readers

How to fix Go to Media > Library, open the image and fill in "Alternative Text". Leave it empty only if the image is purely decorative.

Technical check: Media Library images should have alt text

Where it was found

test-photo

Scanned with axe-core 4.14.0 against WCAG 2.0, 2.1 and 2.2 Level A and AA rules, plus CoreA11y content checks. Automated checks find only part of all accessibility issues; the manual checklist covers the rest. This report does not certify WCAG conformance.
